

CRANE MISSION TIPS & TRICKS

EV3-G Tablet/Chromebooks Version

EV3Lessons.com & FLLTutorials.com

Step 1: Build a Basic Educator Robot

- Start by building the basic educator robot. You can find the instructions inside the EV3 Education Software from the Lobby page
- You will need to build the Driving Base and Medium Motor modules

Step 2: Download the Crane Mission files

- Visit the Challenge Downloads page on the FIRST website
 - Download the Crane Mission Lesson for an overview
 - Download the Crane Mission EV3 Solution. These are building instructions for modifying your robot.
- Visit FLLTutorials.com → CITY SHAPER Resources → Worksheets → Crane Mission Tips
 - Download the .ev3m files

Step 3: Modify the Robot

- Modify your robot using the EV3 Solution file
- A back bumper is constructed to help you align against the south wall of the FIRST LEGO League Table.
- The color sensor is mounted on the left side of the robot so that you can follow lines on the CITY SHAPER mat (Note: that it gets plugged into Port 1. The standard EV3 default is usually Port 3.)

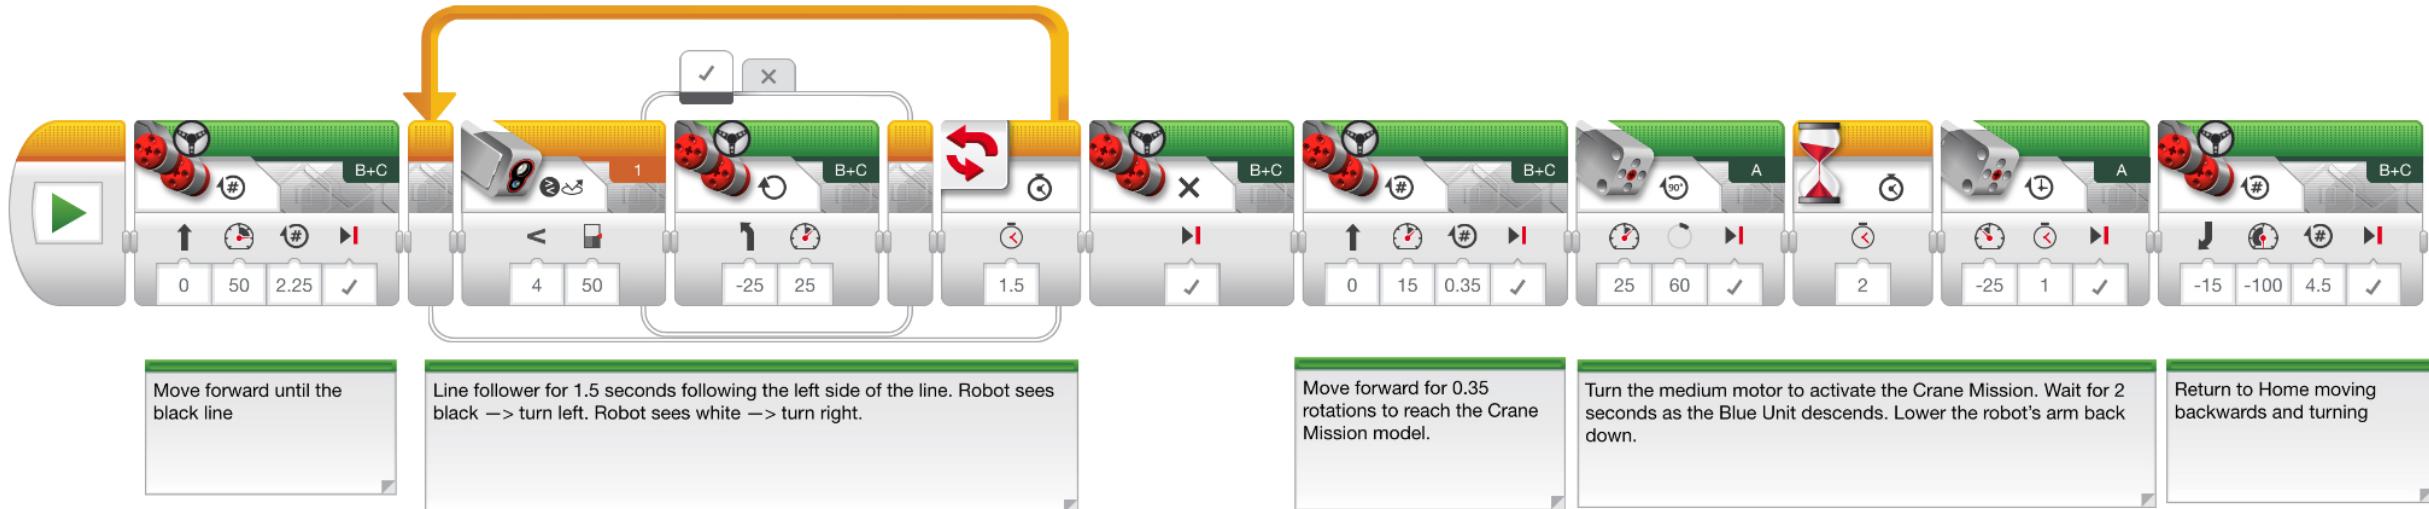

Step 4: Learning the Program

- Turn to the next page to learn the program

Crane Mission Tips & Tricks by EV3Lessons.com and FLLTutorials.com

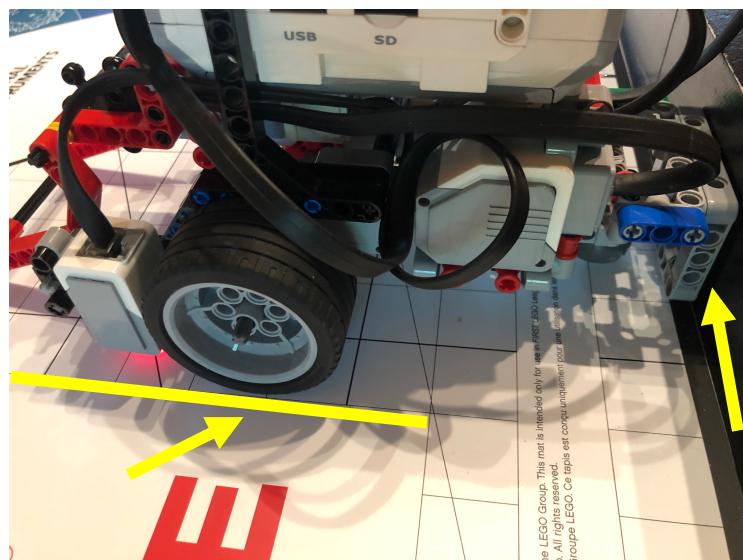

Crane Mission Solution for Chromebooks/Tablets

You can download this Cod file from FLLTutorials.com → Resources → Worksheets

Note: Slightly modified from original code provided by Catherine Sarisky (Sarisky@Roanoke.edu)

Preparations: Setting up in Launch

Align the robot flat against the South wall using the bumper

The left wheel should be along the thin black border of the FIRST LEGO League logo

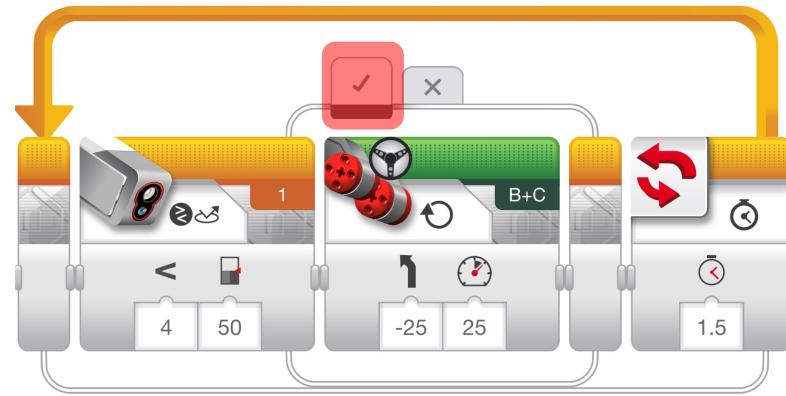

Part 1: Moving out of Launch

This a Green Move Steering Block. It moves both motors at once and they are synchronized. The same block is used again after the line follower ends.

Where can I learn more?
<http://ev3lessons.com/en/TabletLessons.html>

Part 2: Line Following

The color sensor is set to Compare → Reflected Light Intensity on Port 1

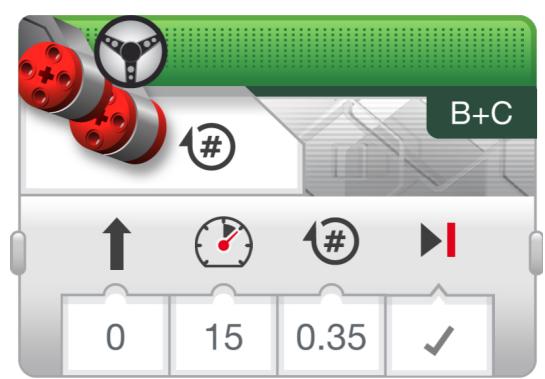

Line follow for 1.5 sec

Note: Since the sensor block and math block from the original code provided by FIRST do not exist in this version of the software, this section of the code uses a basic line follower

The robot turns left when True (ie. the threshold value read by the color sensor is less than 50)

The robot turns right when False (ie. the threshold value read by the color sensor is greater than 50).

Part 3: Approaching the Mission

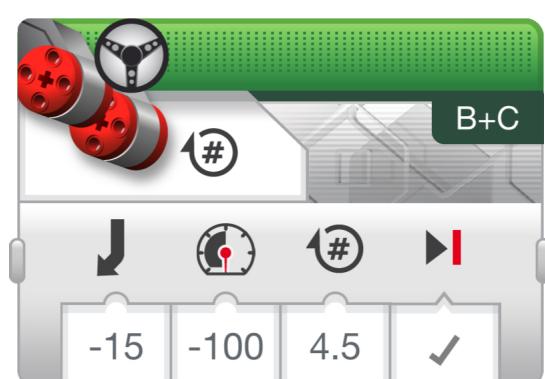

Note: The number of rotations has been increased from the original code provided by FIRST so that the robot can reach the model.

Part 3: Activating the Crane Mission Model

Tip: When activating a motor arm, it is important to start from the same position each time. Make sure the arm is down (as far as it can go) at the start of the program.

Note: This code moves backwards while turning so that your robot returns Home. This has been modified from the original code provided by FIRST which only returned to Launch.

Part 4: Returning to Home Area
